The Importance of Striking Balance: Underemployment, Overemployment, and Psychological and Marital Well-Being in Mothers of Infants, and their Partners

Eamonn Barron & Ela Polek

Work Hours Constraint

- **Definition: Discrepancy between actual and preferred working hours**
- **Two dimensions**
 - Underemployment (UE)
 - Overemployment (OE)
- **Increasingly prevalent**
 - Otterbach (2012)
- **Consequential**

The Study's Groups

- **Underemployed**

- **Adequately employed**

- **Overemployed**

Present Study

- **Well-being indices**
 - Mothers' and fathers':
 - marital well-being (MWB)
 - psychological well-being (PWB)
 - work-family conflict (WFC)
 - Mothers' difficulty arranging childcare
- **Couple dynamics (crossover)**
 - Work-family conflict to marital well-being
 - Psychological well-being to marital well-being

Rationale

- **Work hours constraint generally understudied**
- **Psychological well-being and work productivity (Sanderson & Andrews, 2006)**
- **Centrality of family cohesion for individuals and society (Giutián, 2009)**
- **Dual-earner families most common in OECD**

Literature Review: Psychological Well-Being

- **Otterbach (2012); Friedland & Price (2003); Dooley et al. (2000); Prause & Dooley (1997); Herzog et al. (1991)**
- **Underemployment and overemployment → lower psychological well-being**

Literature Review: Marital Well-Being

- Zvonkovic (1988); Zvonkovic et al. (1988)
- Husbands' underemployment → lower marital well-being for both partners

Literature Review: Couple Dynamics

- **Larson & Almeida (1999): Situations of environmental stress → greater crossover/emotional transmission**

Hypotheses

- **Well-being: More favourable outcomes for adequately employed families (spillover theory)**
- **Couple dynamics: Greater crossover where higher stress (i.e. underemployment and overemployment)**
 - Larson & Almeida (1999)

Sample Description

- **Infant Cohort first wave**
- **3,939 dual-earner couples**
 - 338 Underemployed (9%) → €21,321
 - 1128 Adequately Employed (29%) → €25,248
 - 2473 Overemployed (63%) → €29,314
- **“How many hours do you normally work per week, including any regular overtime work?”**
- **“If you were completely free to choose, how many hours a week (paid work) would you like to work overall?”**

Method

- **Dyadic Adjustment Scale (Sharpley & Rogers, 1984)**
- **Centre for Epidemiological Studies – Depression Scale (Melchior et al., 1993)**
- **2 items on work-family conflict**
- **7 items on difficulty arranging childcare**
- **Multiple imputation (Rubin & Schenker, 1986)**

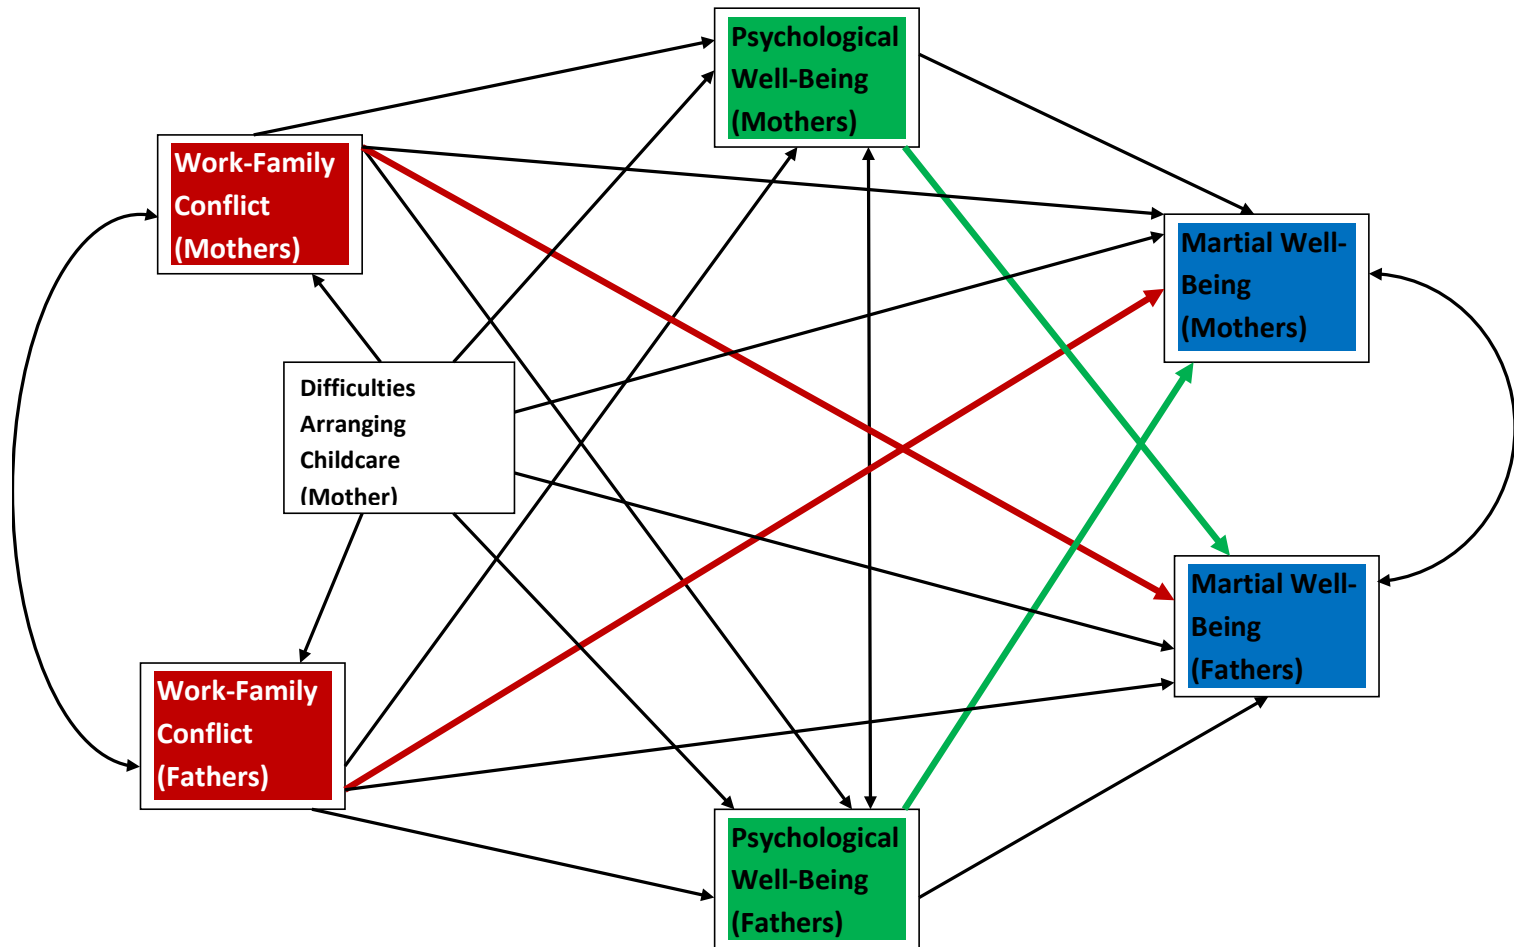

Analysis

- **Well-being outcomes (MANCOVA)**
- **Couple dynamics (Multiple group pathway analysis)**
- **Control variables**
 - Family income
 - Education (Mother)
 - Race/ethnicity (Mother)
 - No. of people in household

Hypothesised Model

Marital Well-Being

Mothers

Error Bars: 95% CI

Fathers

Error Bars: 95% CI

Psychological Well-Being

Error Bars: 95% CI

Error Bars: 95% CI

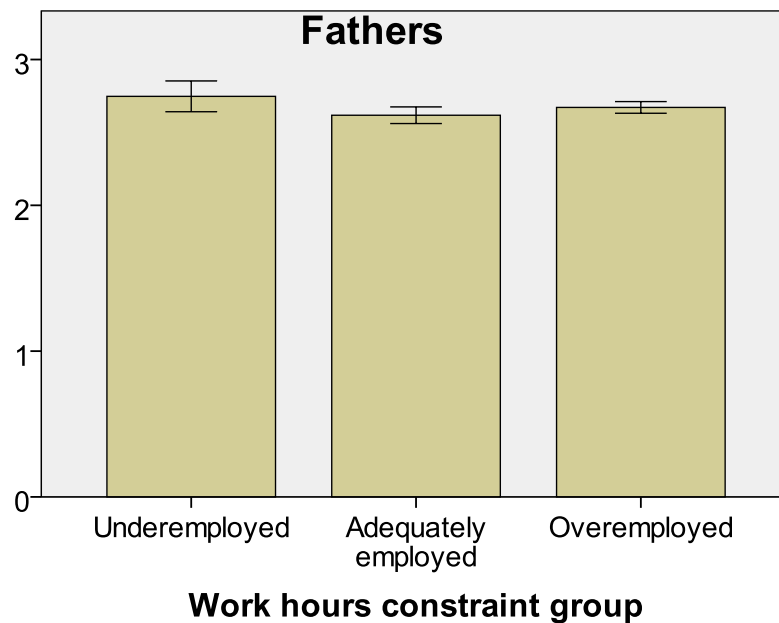

Work-Family Conflict

Mothers

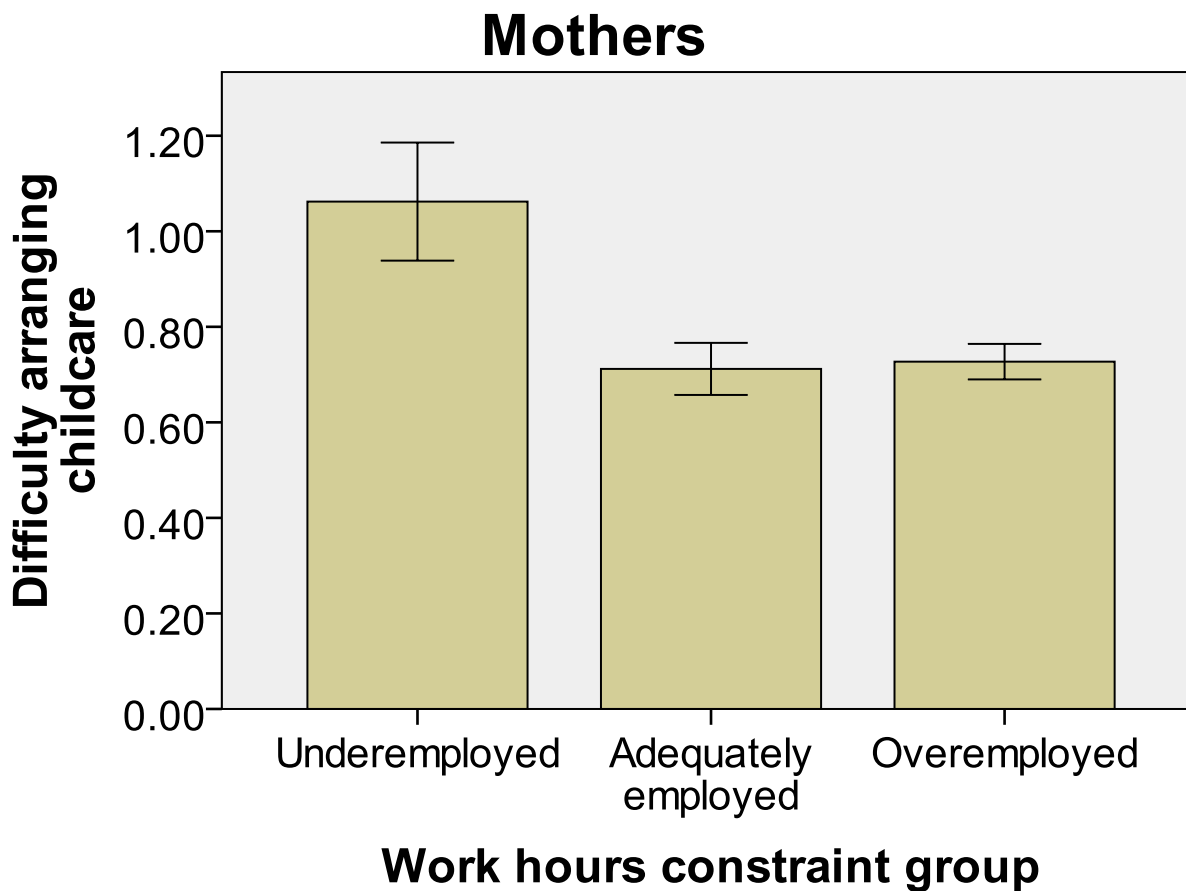

Error Bars: 95% CI

Fathers

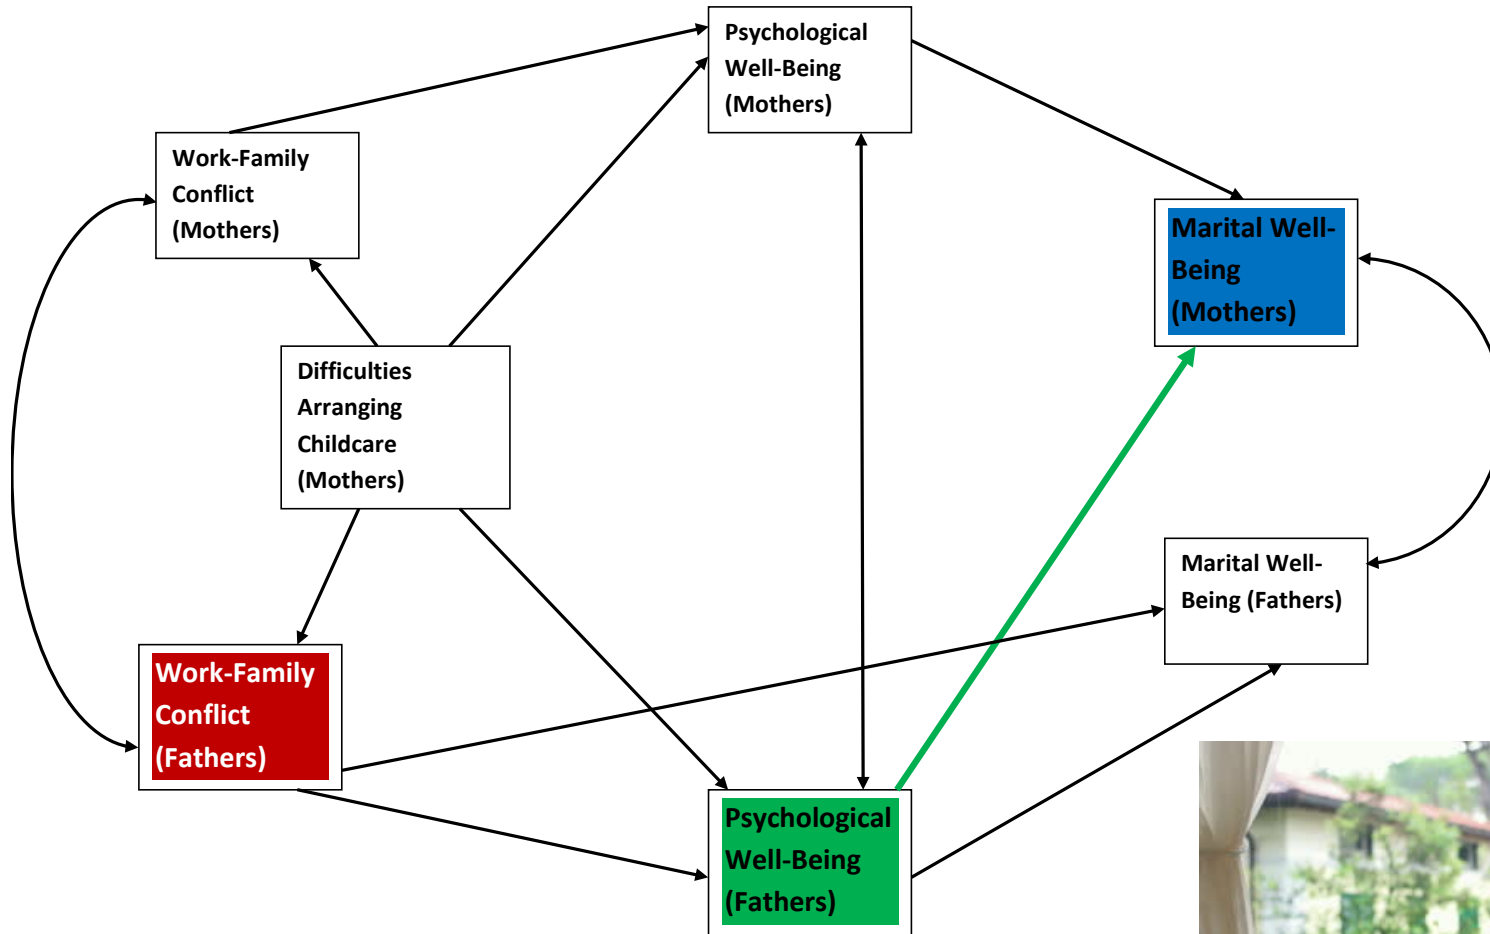

Error Bars: 95% CI

Difficulty Arranging Childcare

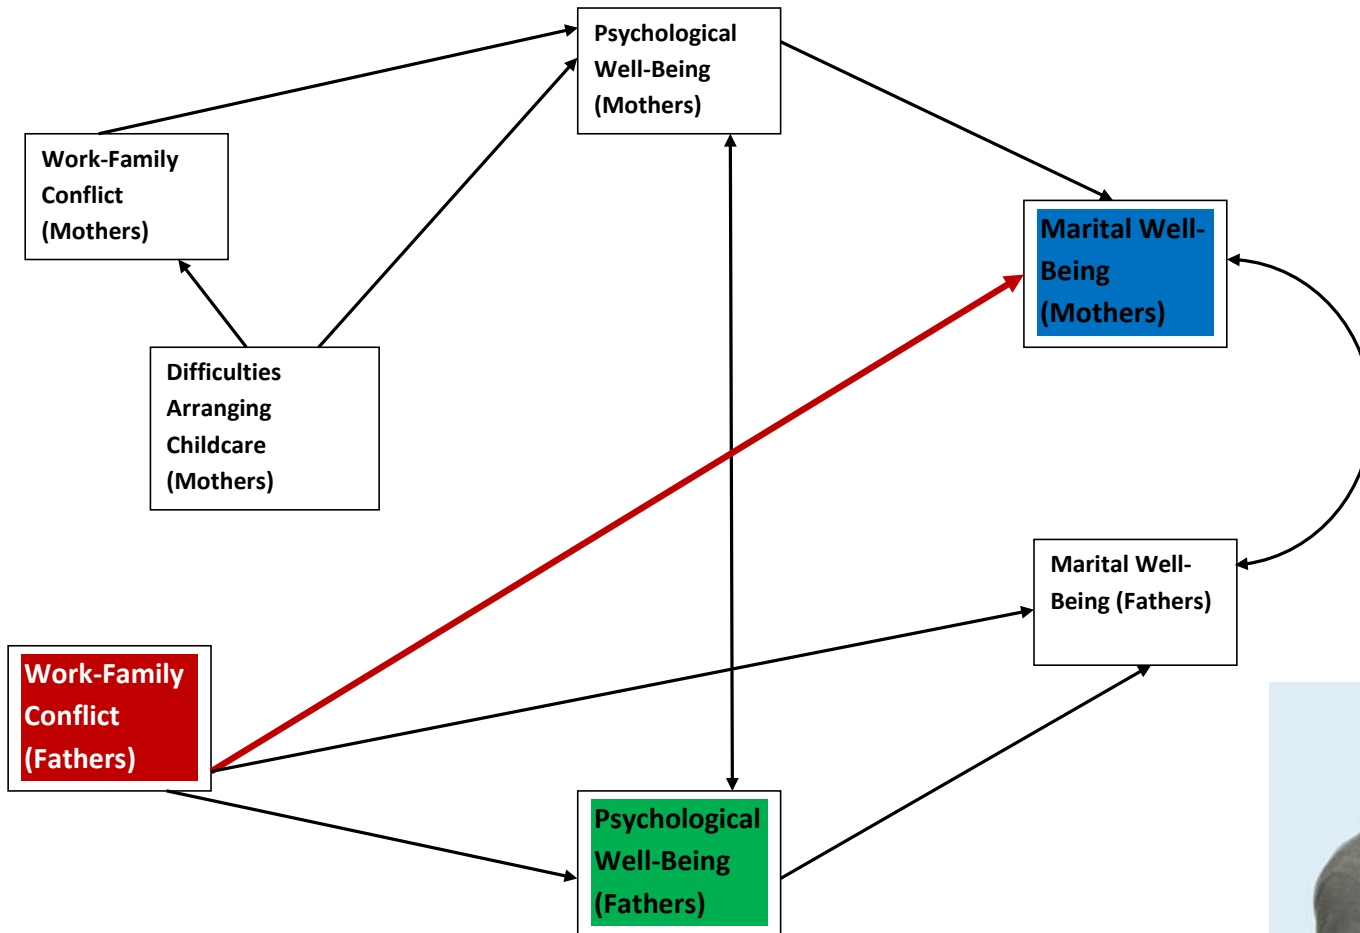

Error Bars: 95% CI

Overemployed

Adequately Employed

Summary: Well-Being Outcomes

- **Mothers:**

- Psychological well-being (AE > UE, OE)
- Work-family conflict (OE > AE, UE)
- Difficulty arranging childcare (UE > OE, AE)

- **Fathers:**

- Marital well-being (AE > UE, OE)

Summary: Couple Dynamics

- **Overemployed**
 - Fathers' psychological well-being → mothers' marital well-being
- **Adequately employed**
 - Fathers' work-family conflict → mothers' marital well-being

Methodological Weakness

- **Cross-sectional design: Causation?**
- **Reliability of measures used?**
 - Difficulty arranging childcare
- **Limits to generalisability of the findings?**

Implications

- **POLICY: Attention to reduction/eradication of under- and overemployment**
- **POLICY: Work place mental health screening**

Future Research

A large red circle with a white center, and a purple horizontal bar across the middle containing the text 'MIND THE GAP' in white capital letters.

MIND THE GAP

- **Unique findings require replication!**
- **Longitudinal**
- **Meaning of work hour preferences**

Take Home Message

- **Mothers' not achieving preferred working hours seems to matter for...**
 - Mothers' psychological well-being
 - Fathers' marital well-being
 - Couple dynamics

Acknowledgments

- **Growing Up in Ireland team**

Thank you for Listening!

ebarron34@gmail.com

Work-Family Conflict Scale

- **“Missed out on home or family activities that you would have liked to have taken part in”**
- **“Your family time is less enjoyable and more pressured.”**
- **Reliability:**
 - Mothers (.65)
 - Fathers (.62)

Difficulty Arranging Childcare scale

- **Has difficulty arranging childcare ever:**
 - “Prevented your looking for a job”
 - “Made you turn down or leave a job”
 - “Stopped you from taking on some study or training”
 - “Made you leave a study or training course”
 - “Restricted the hours you could work or study”
 - “Prevented you from engaging in social activities”
- **Reliability: .47**

CFI	0.918		0.940		0.959			
df	17		17		17			

Note. W in parentheses following a construct label indicates the construct relates to women. P indicates relation of the construct to partners. UE indicates the group 'Underemployed', AE indicates the group 'Adequately Employed', OE indicates the group 'Overemployed'. The values under the heading 'Estimates' represent standardized path coefficients. The values under the heading SE represent the standard errors of the path coefficients. The values under the heading 'UE vs. AE' represent probability (*p*) values for the outcome of two-tailed t-tests comparing path coefficients from the underemployed and adequately employed groups. The values under the heading 'AE vs OE' represent probability (*p*) values for the outcomes of two-tailed t-tests comparing path coefficients from the adequately employed and overemployed groups. RMSEA 10% lower and upper bound confidence intervals are included in parentheses after the RMSEA values. **denotes a significant pathway coefficient (*p* < .001). †denotes a significant difference between path coefficients (*p* < .05).

Value of Statistical Approach Taken

- **MANCOVA**
 - Examine group differences
 - Multiple dependent variables
 - Control for influence of multiple covariates
- **Structural Equation Modelling (Multiple Group Pathway Analysis)**
 - Test overall model (vs. individual coefficients)
 - Handles non-normal data using bootstrap technique
- **Actor Partner Interdependence Model**
 - Examines dyadic data
 - Can test independent effect of one predictor variable on another variable net of the effect of other variables in the model
